

Founding Solana Blockchain Infrastructure / SRE Engineer

Location: Remote / International

Employment Type: Full-time

Seniority: Senior / Founding Engineer

Compensation: €100,000–€140,000 gross annual base + equity/token incentives

Company Overview

Copia Group is building the infrastructure for the next generation of Web3 financial products and payments.

Our long-term vision is to build a **“Stripe for Web3”** — a scalable fintech and payments infrastructure layer that makes blockchain-based financial products easier to build, integrate, operate, and use.

We are expanding our engineering organization internationally, including the development of our Australia presence, and are looking for exceptional engineers who want to have meaningful ownership over the technical foundation of the company.

This is an early-stage, high-ownership environment. Founding engineers will have significant influence over architecture, infrastructure decisions, engineering standards, and the direction of the platform.

About the Role

We are looking for a **Founding Solana Blockchain Infrastructure / SRE Engineer** to design, build, and operate the infrastructure powering our next generation of Web3 financial and payment products.

This is not a traditional DevOps position.

You will work at the intersection of **Solana infrastructure, blockchain nodes and validators, cloud-native systems, Kubernetes, performance engineering, observability, automation, and production reliability**.

You will help establish the infrastructure architecture from the ground up and ensure that our blockchain systems can operate reliably at scale.

What You Will Own

- Design and operate highly available Solana blockchain infrastructure.
- Architect infrastructure for validators, RPC services, indexers, and blockchain data systems.
- Optimize Solana validator and node performance at both software and hardware levels.

- Work with Solana infrastructure technologies such as **Agave, Firedancer and related ecosystem tooling**.
- Build Kubernetes-based infrastructure for blockchain workloads.
- Design scalable cloud and hybrid infrastructure across AWS, GCP and other environments.
- Establish GitOps and Infrastructure-as-Code practices.
- Build automated deployment, upgrade, rollback, and disaster-recovery processes.
- Develop comprehensive monitoring, alerting, logging and observability systems.
- Establish SLOs, SLIs and operational standards for blockchain infrastructure.
- Investigate difficult performance and reliability problems across infrastructure and blockchain layers.
- Optimize CPU, memory, storage, networking and hardware configurations for blockchain workloads.
- Build automation for node provisioning, maintenance, upgrades and incident response.
- Collaborate closely with backend, protocol, smart-contract and product engineers.
- Help establish security, reliability and operational standards across the engineering organization.
- Mentor engineers and contribute to the technical direction of the infrastructure team.

Technical Environment

Depending on the product roadmap, you may work with:

- **Solana**
- Agave
- Firedancer
- Rust
- Kubernetes
- Docker
- Terraform
- Crossplane
- GitOps
- AWS
- GCP
- Azure
- Prometheus
- Grafana
- Loki
- Thanos
- PostgreSQL
- Kafka
- Redis
- Linux
- CI/CD
- Infrastructure as Code
- High-availability architectures
- Blockchain RPC infrastructure
- Validator infrastructure
- Performance and hardware optimization

What We're Looking For

Required

- 7+ years of experience in infrastructure, SRE, DevOps, cloud engineering, or related engineering roles.
- Strong production experience with **Kubernetes and Docker**.
- Deep understanding of cloud infrastructure and distributed systems.
- Strong Linux and networking knowledge.
- Experience designing highly available and scalable production infrastructure.
- Strong Infrastructure-as-Code experience, ideally Terraform and/or Crossplane.
- Experience with GitOps and automated deployment systems.
- Strong observability experience with tools such as Prometheus and Grafana.
- Experience troubleshooting complex production performance and reliability issues.
- Strong understanding of security, availability, scalability and operational resilience.

Strongly Preferred

- Professional experience with **Solana infrastructure**.
- Experience operating Solana validators or RPC infrastructure.
- Experience with **Agave, Firedancer or other Solana validator clients**.
- Rust experience.
- Blockchain node infrastructure experience.
- Hardware-level performance optimization.
- Experience with blockchain data/indexing infrastructure.
- Experience operating infrastructure at significant scale.
- Experience building infrastructure from scratch in an early-stage company.
- Previous technical leadership or SRE leadership experience.

What Would Make You Exceptional

You are someone who can look at a complex blockchain infrastructure problem and determine whether the solution belongs in:

hardware → Linux → networking → Kubernetes → cloud architecture → validator configuration → blockchain software → application infrastructure.

You don't simply deploy infrastructure — you understand how the entire system behaves under load.

You are comfortable moving between low-level performance optimization and high-level architecture decisions.

You can build the infrastructure yourself, establish engineering standards, and eventually help grow the team around it.

Why Join Copia Group?

- **Founding-level ownership** over critical infrastructure.
- Opportunity to shape the architecture of a **Web3 fintech/payments platform** from the ground up.
- Work directly with blockchain infrastructure rather than maintaining conventional SaaS infrastructure.
- Significant influence over technology choices and engineering standards.
- International and remote-first environment.
- Opportunity to work across **Solana, Web3, fintech, payments and distributed systems**.
- Competitive salary plus **equity/token-based upside**.
- Opportunity to grow into a principal/technical leadership position as the infrastructure organization expands.

Compensation

Base salary: €100,000–€140,000 gross per year

For exceptional founding-level candidates, compensation may be structured with:

- Competitive base salary
- Equity
- Token incentives where applicable
- Performance-based bonus
- Additional benefits depending on location and contract structure

The final package will depend on experience, technical scope, location, and level of ownership.

Hiring Process

1. Introductory conversation with the recruitment team
2. Technical discussion focused on Solana infrastructure and distributed systems
3. Architecture / infrastructure discussion
4. Final conversation with the technical leadership team
5. Offer

We are looking for an engineer who wants to build the infrastructure, not simply operate it.
