

Founding Web3 Mobile/Product Engineer

Location: Remote / Global

Employment: Full-time

Seniority: Senior / Founding Engineer

Domain: Web3 · Fintech · Payments · Mobile

About the Role

We're looking for a **Founding Web3 Mobile/Product Engineer** to help build the next generation of Web3 financial infrastructure.

The product vision is similar to **Stripe for Web3** — making blockchain-powered payments and financial products easier for businesses and users to integrate and use.

This is a founding-level engineering role for someone who enjoys owning products end-to-end rather than working on only one isolated layer. You'll have significant influence over the mobile experience, product architecture, Web3 integrations, backend services, and engineering direction.

What You'll Do

- Own and develop mobile products for **iOS and Android**, primarily using Flutter/Dart.
- Build Web3 wallet, payment, transaction, account, and financial workflows.
- Connect mobile experiences with blockchain infrastructure, APIs, wallets, and payment systems.
- Design and implement scalable product architecture from MVP through production.
- Work across frontend, backend, APIs, authentication, databases, and cloud infrastructure when needed.
- Integrate blockchain networks and Web3 services into user-facing products.
- Build secure transaction and payment flows.
- Work with product and engineering stakeholders to turn requirements into practical solutions.
- Establish engineering standards, testing practices, architecture patterns, and development workflows.
- Help shape product decisions as an early engineering contributor.
- Troubleshoot production issues and continuously improve reliability and performance.
- Evaluate new technologies and Web3 infrastructure relevant to the product.
- Mentor future engineers as the team grows.

Technical Environment

Mobile

- Flutter
- Dart
- BLoC / Cubit
- Riverpod
- Clean Architecture
- TDD

Web & Backend

- TypeScript / JavaScript
- Node.js
- REST APIs
- Serverless architecture
- Firebase / Firestore

Web3

- EVM / Ethereum ecosystem
- Smart-contract integrations
- Wallet integrations
- Blockchain RPC
- On-chain transaction flows
- Crypto payments
- Token and asset interactions

Payments & Infrastructure

- Payment APIs
- Stripe-like payment infrastructure
- Authentication and identity
- Cloud services
- Monitoring and production systems

What We're Looking For

- 5+ years of professional software engineering experience.
- Strong commercial experience with **Flutter and Dart**.
- Experience shipping production iOS and Android applications.
- Strong understanding of software architecture and maintainable code.
- Experience building products end-to-end, from concept/MVP through production.

- Practical Web3/blockchain experience.
- Experience integrating wallets, blockchain APIs, smart contracts, or crypto payment flows.
- Strong API and backend integration experience.
- Understanding of authentication, security, testing, and production deployment.
- Ability to work independently and make sound technical decisions.
- Strong product mindset — you care about **why** something is being built, not only how.
- Comfortable working in an early-stage environment where requirements can evolve quickly.

Strongly Preferred

- Experience building crypto wallets or Web3 mobile applications.
- Experience with crypto payments or fintech products.
- Experience with EVM-compatible networks.
- Experience integrating Stripe or other payment providers.
- Startup or founding-engineer experience.
- Experience taking a product from **0** → **1**.
- Experience with Firebase and serverless infrastructure.
- Experience with TypeScript/Node.js.
- Experience working with smart contracts and Web3 SDKs.
- Familiarity with AI-assisted software development.

What Success Looks Like

First 30 Days

- Understand the product architecture and Web3/payment infrastructure.
- Become productive in the existing codebase.
- Identify opportunities to improve the mobile architecture and developer workflow.
- Begin contributing production features.

First 90 Days

- Own significant mobile and Web3 product features.
- Build reliable integrations between the mobile application and Web3/payment infrastructure.
- Improve testing, observability, and development processes.
- Contribute directly to product and technical decisions.

6–12 Months

- Become a core technical owner of the mobile/product platform.

- Help establish scalable architecture and engineering standards.
- Drive major product initiatives from concept to production.
- Help build and mentor the engineering team as the company scales.

Why Join

This is not a conventional mobile-development position.

As a **Founding Web3 Mobile/Product Engineer**, you'll have the opportunity to influence the product, architecture, engineering culture, and technical direction from an early stage.

You'll work at the intersection of:

Mobile × Web3 × Fintech × Payments

with the opportunity to help build infrastructure that makes blockchain-based financial products as accessible and developer-friendly as modern fintech platforms.
