

Senior Blockchain Infrastructure / Backend Engineer

Location: Remote / Global

Employment Type: Full-time

Department: Engineering

Level: Senior

About Copia Group

Copia Group is building a “**Stripe for Web3**” — a next-generation fintech and payments infrastructure platform designed to make blockchain-based payments, digital assets, and financial services easier to integrate and use.

As we expand internationally, including our Australia operations, we’re looking for a **Senior Blockchain Infrastructure / Backend Engineer** to help build the backend and infrastructure layer powering our Web3 financial products.

The Role

We’re looking for a senior engineer who can work across **backend systems, blockchain infrastructure, smart-contract integrations, and distributed systems**.

You’ll be responsible for designing and operating highly reliable services that interact with blockchain networks and support transactions, wallets, payments, digital assets, and Web3 financial workflows.

This is a hands-on engineering role with significant ownership over architecture, scalability, reliability, and production systems.

Key Responsibilities

- Design and develop scalable backend services for Web3 fintech and payment products.
- Build infrastructure for interacting with **EVM-compatible blockchains and other blockchain networks**.
- Develop blockchain transaction processing, indexing, monitoring, and event-driven services.
- Build and maintain APIs and backend services using languages such as **Go, Rust, TypeScript/Node.js, or Python**.
- Integrate and interact with smart contracts using technologies such as **Solidity, ethers.js, web3.js, or equivalent tooling**.

- Design systems capable of handling high transaction volumes with strong reliability and low latency.
- Build blockchain data pipelines, indexers, event listeners, and transaction monitoring systems.
- Design secure wallet, custody, signing, and transaction-processing infrastructure where required.
- Implement observability, alerting, logging, metrics, and incident-response processes.
- Improve infrastructure scalability, availability, and disaster recovery.
- Work with DevOps and engineering teams on **AWS/GCP/Azure, Kubernetes, Docker, Terraform, and CI/CD**.
- Participate in architecture decisions and technical design reviews.
- Troubleshoot complex production and blockchain infrastructure issues.
- Contribute to engineering standards, documentation, testing, and security practices.
- Collaborate closely with product, frontend, smart-contract, and infrastructure engineers.

Requirements

- **5+ years of professional software engineering experience.**
- Strong backend development experience with **Go, Rust, Node.js/TypeScript, Python, or similar**.
- Practical experience building or maintaining **blockchain/Web3 systems**.
- Strong understanding of **EVM architecture, transactions, RPC, smart contracts, wallets, and blockchain events**.
- Experience building production-grade APIs and distributed backend systems.
- Experience with databases such as **PostgreSQL, Redis, MongoDB, or similar**.
- Strong understanding of asynchronous/event-driven architecture and message queues such as **Kafka, RabbitMQ, or similar**.
- Experience with **Docker and Kubernetes**.
- Good knowledge of cloud infrastructure, preferably **AWS**.
- Experience with **Terraform or infrastructure-as-code**.
- Strong understanding of CI/CD and production deployment practices.
- Solid knowledge of security principles for financial and blockchain applications.
- Ability to investigate complex technical problems independently.
- Strong communication and collaboration skills.

Web3 / Blockchain Experience

Experience with several of the following is highly desirable:

- Ethereum / EVM
- Layer 2 networks
- Solidity
- Smart-contract interaction
- Blockchain indexing

- RPC infrastructure
- Transaction simulation
- Wallet infrastructure
- Tokenization
- ERC-20 / ERC-721 / ERC-1155
- DeFi protocols
- Stablecoins
- Cross-chain infrastructure
- Blockchain analytics
- On-chain monitoring
- Solana, Sui, or other non-EVM networks

Nice to Have

- Experience in **fintech, payments, banking, digital assets, or crypto**.
- Experience designing systems handling **high RPS / high transaction volumes**.
- Experience with blockchain nodes and node infrastructure.
- Experience with **Go or Rust**.
- Knowledge of MEV, mempool infrastructure, gas optimization, or transaction simulation.
- Experience with security audits or blockchain security.
- Experience with observability tools such as **Prometheus, Grafana, OpenTelemetry, or Datadog**.
- Experience working in an early-stage startup or rapidly evolving product environment.

What You'll Own

You won't simply maintain existing infrastructure. You'll have ownership over important parts of the platform, including:

Blockchain connectivity → Transaction processing → Backend services → Data/indexing → Infrastructure → Monitoring → Production reliability

What We Offer

- Opportunity to build core infrastructure for a **Web3 fintech/payments platform**.
- High ownership and influence over technical architecture.
- Work on real-world blockchain and financial infrastructure rather than experimental prototypes.
- International engineering environment.
- Remote-friendly working model.
- Competitive compensation based on experience and location.
- Opportunity to work with modern blockchain, cloud, and distributed-systems technologies.
- Career growth as Copia Group expands internationally.

Ideal Candidate

The ideal candidate is a **strong backend/infrastructure engineer who genuinely understands blockchain**, rather than someone who only has surface-level Web3 experience.

You should be comfortable going from:

**“How does this blockchain transaction work?” → “How should we architect the service?”
→ “How do we deploy it?” → “How do we monitor it at scale?”**

If you enjoy solving difficult distributed-systems problems and want to build infrastructure for the next generation of Web3 financial products, we'd like to hear from you.
