

Senior Blockchain / Protocol Engineer

Location: Remote / Global

Employment Type: Full-time

Department: Engineering

Level: Senior / Lead

Industry: Web3 · Fintech · Blockchain · Payments

About Copia Group

Copia Group is building a **Stripe-like infrastructure for Web3** — a next-generation fintech and payments platform designed to make blockchain-based payments, digital assets, and financial services easier to build and use.

As we expand internationally, including our planned presence in Australia, we're building a strong engineering team focused on secure, scalable blockchain infrastructure and real-world financial applications.

The Role

We are looking for a **Senior Blockchain / Protocol Engineer** to take ownership of the architecture and development of blockchain protocols and smart-contract infrastructure powering our Web3 fintech platform.

You will work across **EVM-compatible networks and emerging blockchain ecosystems**, designing secure protocols, smart contracts, transaction infrastructure, and integrations.

This is a hands-on engineering role with significant ownership. You will work closely with backend, frontend, product, and security engineers to take blockchain functionality from architecture through production.

Key Responsibilities

- Design and develop **smart contracts and blockchain protocols** for Web3 fintech and payment applications.
- Architect secure and scalable **DeFi, payment, tokenization, and RWA infrastructure**.
- Develop and maintain Solidity-based smart contracts for EVM networks.
- Research and evaluate blockchain technologies, L2s, interoperability solutions, and emerging protocols.
- Design blockchain integrations, bridges, transaction flows, and on-chain/off-chain architectures.
- Build backend services that interact with smart contracts and blockchain networks.

- Review smart-contract architecture and identify potential security and economic risks.
- Develop comprehensive unit, integration, fuzzing, and invariant tests.
- Participate in protocol audits and security reviews.
- Optimize gas usage, transaction throughput, reliability, and protocol performance.
- Work with cryptographic primitives and formal verification where appropriate.
- Collaborate with product and engineering leadership to translate business requirements into technical architecture.
- Mentor engineers and contribute to engineering standards and best practices.
- Take ownership of blockchain features from **architecture** → **development** → **testing** → **deployment** → **production**.

Required Qualifications

- **5+ years of software engineering experience**, with significant blockchain experience.
- **3+ years of hands-on smart contract / protocol engineering experience.**
- Strong experience with **Solidity and EVM architecture**.
- Strong understanding of:
 - Ethereum
 - Smart contracts
 - DeFi protocols
 - Token standards
 - Oracles
 - DEX architecture
 - Staking / vesting mechanisms
 - Bridges and cross-chain systems
 - L2 infrastructure
- Strong understanding of smart-contract security and common attack vectors.
- Experience with **Foundry, Hardhat, or comparable blockchain development frameworks**.
- Strong experience writing automated smart-contract tests.
- Proficiency in at least one systems/backend language such as **Rust, Go, Python, or TypeScript**.
- Experience designing blockchain systems beyond simply integrating existing contracts.
- Strong understanding of distributed systems and blockchain architecture.
- Ability to independently own complex technical projects.

Nice to Have

- Experience with **Sui / Move**.
- Experience with **Solana / Rust**.
- Experience with **Stacks / Clarity** or other alternative blockchain ecosystems.
- Formal verification experience.
- Experience with blockchain security auditing.

- Experience building DEXs, lending protocols, RWA platforms, payment protocols, or stablecoin infrastructure.
- Experience with account abstraction / smart accounts.
- Experience with cross-chain protocols and interoperability.
- Experience with blockchain indexing and transaction simulation.
- Experience working on high-throughput or low-latency blockchain infrastructure.
- Open-source blockchain contributions.
- Experience leading blockchain engineering teams.

Tech Stack

Blockchain: Ethereum, EVM, L2s, Sui, Solana

Smart Contracts: Solidity, Move, Rust, Clarity

Development: Foundry, Hardhat, Ethers.js

Backend: Rust, Python, Node.js / TypeScript

Infrastructure: Docker, cloud infrastructure, CI/CD

Security: Formal verification, fuzzing, invariant testing, smart-contract auditing

What We're Looking For

We're looking for someone who goes beyond simply writing smart contracts.

The ideal engineer understands **why a protocol is designed a certain way**, can challenge architectural decisions, identify security and economic risks, and independently turn a protocol concept into production-ready infrastructure.

You should be comfortable working in ambiguous environments, researching new blockchain technologies, and taking ownership of technically complex problems.

Why Join Copia Group?

- Build core infrastructure for a **Web3 fintech and payments platform**.
- Work on problems at the intersection of **blockchain, fintech, payments, DeFi, and RWA**.
- Significant technical ownership and influence over protocol architecture.
- Opportunity to work across multiple blockchain ecosystems.
- International engineering environment.
- Opportunity to help shape the architecture of a new-generation Web3 financial platform.
- Collaborate with experienced engineers, product leaders, and blockchain specialists.

Ideal title for Andrii: Senior Blockchain / Protocol Engineer

Alternative if you want to position him at a higher level: Lead Blockchain / Protocol Engineer.
