

Senior DevOps / Blockchain Infrastructure Engineer

Location: Australia / Remote

Employment Type: Full-time

Level: Senior / Staff

Industry: Web3 / FinTech / Blockchain Infrastructure

About Copia Group

Copia Group is building a **Web3 fintech and payments infrastructure platform — essentially “Stripe for Web3.”** Our goal is to make blockchain-based payments, financial infrastructure, and digital assets easier for businesses and users to integrate and operate at scale.

As we expand internationally, including our Australia operations, we're building a strong engineering team focused on reliable, secure, and scalable blockchain infrastructure.

The Role

We're looking for a **Senior DevOps / Blockchain Infrastructure Engineer** to take ownership of the infrastructure powering our Web3 platform.

You'll work across **cloud infrastructure, blockchain nodes, deployment automation, observability, security, CI/CD, and reliability**, partnering closely with backend, protocol, and smart-contract engineers.

This is a hands-on role for someone who enjoys solving complex infrastructure problems and building systems that can operate reliably at scale.

What You'll Do

- Design, deploy, and maintain scalable infrastructure for blockchain and Web3 applications.
- Manage and operate blockchain nodes across **EVM and other relevant networks**.
- Build highly available and fault-tolerant infrastructure for blockchain RPC and API services.
- Develop and maintain **CI/CD pipelines** for backend, smart-contract, and infrastructure deployments.
- Automate infrastructure provisioning and configuration using **Terraform, Ansible, or similar tools**.
- Manage cloud infrastructure across **AWS, GCP, or Azure**.

- Containerize and orchestrate services using **Docker and Kubernetes**.
- Implement monitoring, logging, alerting, and observability for production systems.
- Improve system reliability, scalability, performance, and disaster recovery.
- Develop automation for blockchain node deployment, upgrades, backups, and health monitoring.
- Work with engineering teams to improve deployment and release processes.
- Help secure infrastructure, secrets, wallets, APIs, and blockchain-related services.
- Troubleshoot production incidents and participate in on-call / incident-response processes.
- Establish infrastructure standards and best practices as the engineering organization grows.
- Support infrastructure for Web3 payments, wallets, smart contracts, and other blockchain services.

Required Experience

- **5+ years of professional experience** in DevOps, SRE, Platform Engineering, Infrastructure Engineering, or a related field.
- Strong experience with **Linux and networking**.
- Production experience with **AWS, GCP, or Azure**.
- Strong Docker and **Kubernetes** experience.
- Experience with **Terraform or Infrastructure as Code**.
- Strong understanding of **CI/CD and automated deployment pipelines**.
- Experience with monitoring and observability tools.
- Strong scripting/programming skills in **Python, Go, Rust, Bash, or similar**.
- Experience operating production systems with high availability and reliability requirements.
- Strong understanding of distributed systems and cloud architecture.

Blockchain / Web3 Experience

Strong candidates should also have experience with one or more of:

- Running and maintaining **Ethereum/EVM blockchain nodes**.
- Blockchain RPC infrastructure.
- L1/L2 infrastructure.
- Blockchain indexing and data infrastructure.
- Smart-contract deployment pipelines.
- Web3 wallets and key-management infrastructure.
- Cross-chain infrastructure.
- Blockchain monitoring and transaction processing.
- EVM networks such as Ethereum, Polygon, Arbitrum, Optimism, Base, BNB Chain, etc.
- Blockchain infrastructure using **Go, Rust, or TypeScript**.

- Experience with tools such as **Foundry, Hardhat, The Graph, Docker, Kubernetes, Terraform**, or similar.

Nice to Have

- Experience with **Web3 payments or financial infrastructure**.
- Experience with stablecoins or digital-asset infrastructure.
- Experience operating blockchain nodes at scale.
- Experience with **high-throughput / low-latency systems**.
- Experience with AWS EKS, GKE, or similar managed Kubernetes platforms.
- Experience with Kafka, RabbitMQ, Redis, PostgreSQL, or other distributed infrastructure.
- Experience with Prometheus, Grafana, Datadog, OpenTelemetry, or similar observability platforms.
- Security engineering experience involving blockchain infrastructure.
- Experience with multi-chain systems or cross-chain protocols.
- Open-source blockchain infrastructure contributions.

Leadership & Collaboration

At the Senior level, you'll be expected to do more than operate infrastructure.

You'll:

- Own infrastructure initiatives from architecture through production.
- Mentor other engineers.
- Participate in technical architecture decisions.
- Establish DevOps/SRE best practices.
- Work closely with protocol, backend, product, and security teams.
- Help define the infrastructure roadmap as Copia Group scales.

What We're Looking For

We're especially interested in engineers who are:

Infrastructure-first: You understand how to build systems that remain reliable under pressure.

Blockchain-native: You understand that blockchain infrastructure has different operational challenges from conventional SaaS.

Automation-minded: If something is being done manually repeatedly, you want to automate it.

Security-conscious: You understand the importance of infrastructure security, secrets, keys, access control, and production isolation.

Hands-on: You are comfortable writing code, debugging Linux systems, configuring infrastructure, and responding to production issues.

Scalable: You think beyond "it works" and consider reliability, observability, performance, and long-term maintainability.

Technology Stack

Our infrastructure may include:

Cloud: AWS / GCP / Azure

Containers: Docker / Kubernetes

IaC: Terraform

Blockchain: Ethereum / EVM / L2s / Multi-chain

Languages: Go / Rust / Python / TypeScript / Bash

CI/CD: GitHub Actions / GitLab CI / similar

Databases: PostgreSQL / Redis / NoSQL

Messaging: Kafka / RabbitMQ

Observability: Prometheus / Grafana / Datadog / OpenTelemetry

Blockchain tooling: Foundry / Hardhat / RPC / Indexing infrastructure

Why Join Copia Group?

- Build infrastructure for a “**Stripe for Web3**” vision.
- Work on real-world **Web3 fintech and payments infrastructure**.
- Help architect systems from the ground up rather than maintaining legacy infrastructure.
- Work with blockchain, cloud, distributed systems, and emerging technologies.
- Opportunity to influence technical architecture and infrastructure strategy.
- International team with **Australia expansion**.
- Senior-level ownership and significant technical impact.

Ideal Candidate Profile

The strongest candidate would look something like:

Senior DevOps / SRE / Infrastructure Engineer + meaningful blockchain experience + strong AWS/Kubernetes/Terraform skills + excellent Linux/networking knowledge + ability to build highly available production infrastructure.

Best-fit backgrounds: Blockchain Infrastructure Engineer, Senior DevOps Engineer, SRE, Platform Engineer, Cloud Infrastructure Engineer, Protocol Infrastructure Engineer, or Senior Blockchain Engineer with strong DevOps experience.
